EVOLVED TECHNOLOGY

Accelerating AI breakthroughs in healthcare and life sciences

AI is transforming healthcare

Opportunities

- Drug discovery and lead optimization
- Toxicity modeling
- Clinical trial strategy
- Patient and clinician interfaces
- Patient prognostication and precision medicine
- Hypothesis generation and AI scientists
- Intelligent EHRs

...and endless more

Challenges

Data scarcity: The majority of scientific data is not ML-ready, and homogenous datasets are limited in size

High performance compute access: AI/ML models require large numbers of scarce and expensive GPUs

Cross-disciplinary domain expertise: Biological and biomedical systems are incredibly complex, and modeling them requires scientific and computational expertise

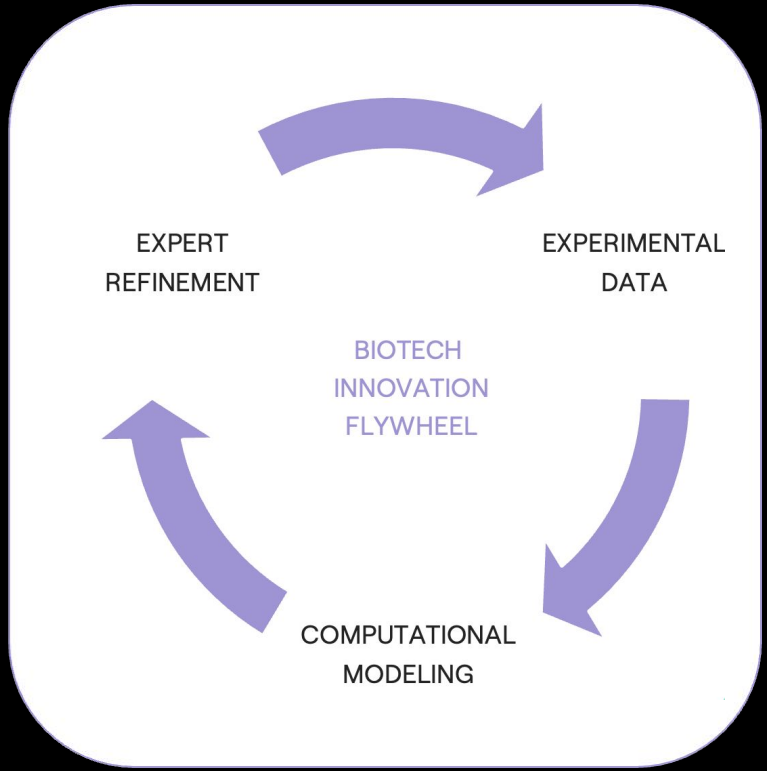
Success requires interdisciplinary teams

SCIENTIST

Understands experimental constraints and target system complexities

ENGINEER

Builds computational frameworks to model the target system within scientific constraints



Community Growth

Evolved participants form a vibrant and engaged worldwide community across several disciplines of science

Grow the Evolved Team with members in different regions of the world

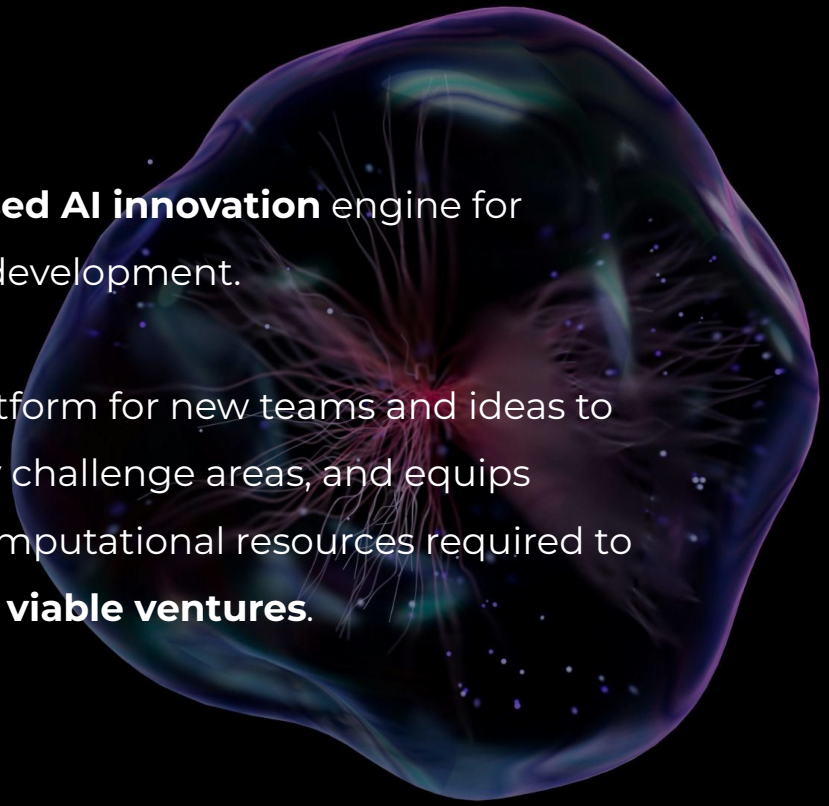
Local meetups and events in strategic hubs

Virtual seminars to showcase novel ideas and inspire innovation

The Evolved Initiative

Evolved is a **hackathon-based AI innovation** engine for global biotech and clinical development.

The program provides a platform for new teams and ideas to develop within high-priority challenge areas, and equips technical talent with the computational resources required to **turn early-stage ideas into viable ventures**.



2025 regional hackathon projects

PatientSim

Longitudinal health data generation with LLMs

Neo-Refine

AI neo-antigen selection for cancer vaccines

skyhook

Protein binding specificity prediction

BenchSite

Visualizing binding site change from mutations

HARMONA

"Harmonizing biometric data for personalized preventative care"

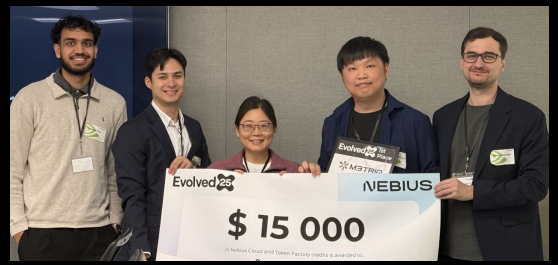
Harmonizing biometric data for precision care

And many more...

Evolved 25

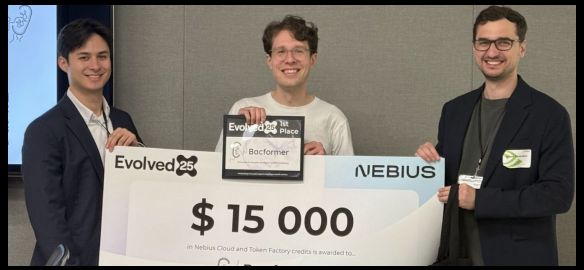
Gardn Bio

Precision RNA therapeutic design via “CUDA for RNA”



M3TRIQ

Repurposing failed drug candidates



Bacformer

Generative modeling for bacterial genomics

What are our Major themes this Hack?

Harnessing wearable technology

21st Century Healthcare

Clinical Operations

Bench <> Discovery

Biological & Molecular Systems

Scaling Workflows

EEG/ECG Interpretation

Neuro-Tech

This Weekend's Hack

Friday: Kick-off @ Highline Beta

- Meet your team members and think of ideas
- Network with other attendees and community members

Saturday: Offline Hacking

- Work remotely and asynchronously on projects

Sunday: Final Sprint + Demos

- Join us back at Highline Beta to finalize your projects together
- Enjoy lunch then prepare to pitch your project in front of a series of judges

Nebius Token Factory

As part of the Evolved initiative, Token Factory provides developers with the industrial-grade infrastructure needed to run the world's most powerful open-source models at lightning speed.

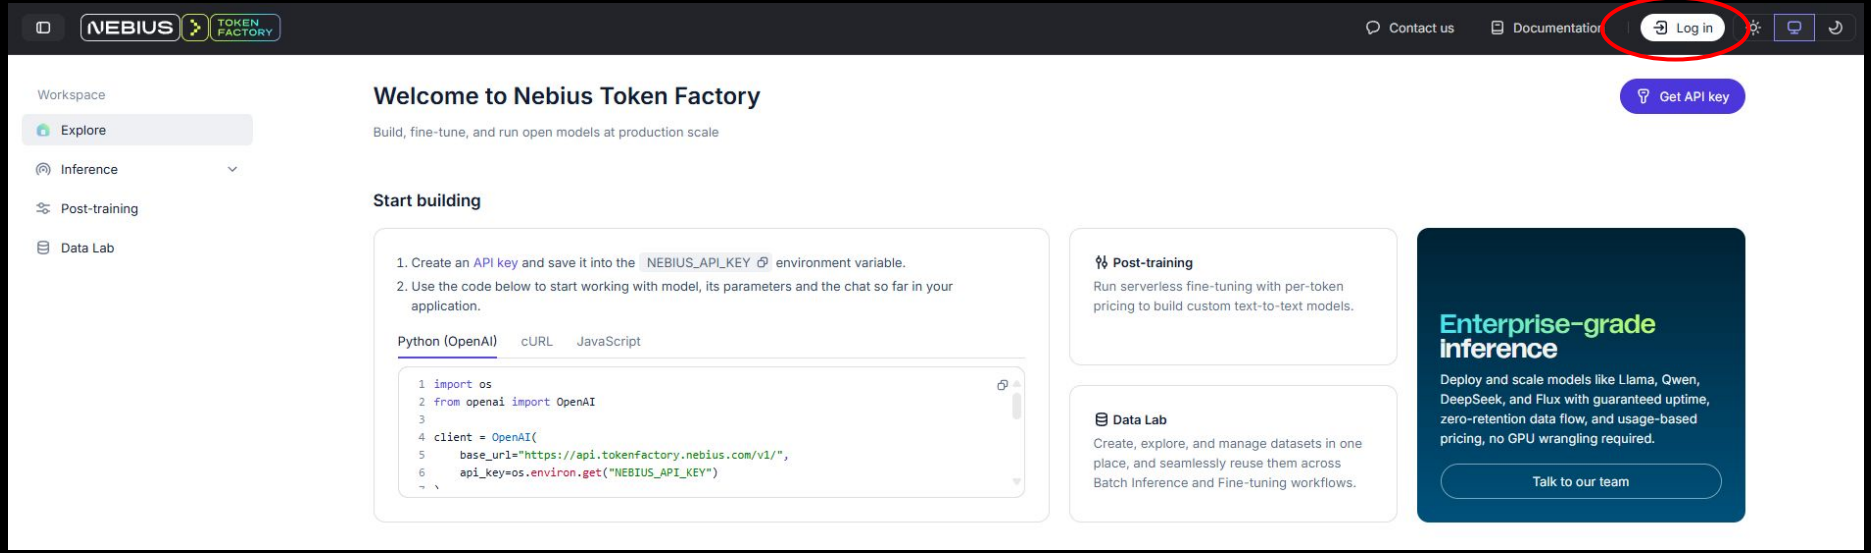
Each team is allotted $200 worth of credits

https://tokenfactory.nebius.com/

How to Redeem Credits

Step 1 - Create an account

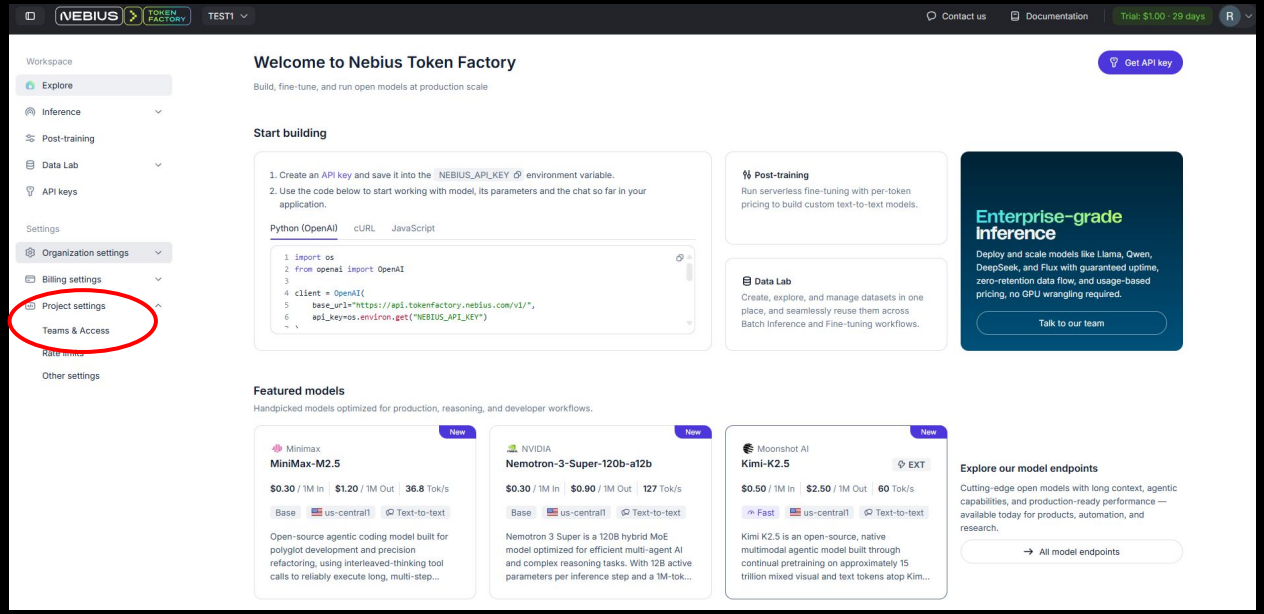
Note: you will be asked for billing information but you will not be billed for overuse, nebius is pay as you go preloaded with funds

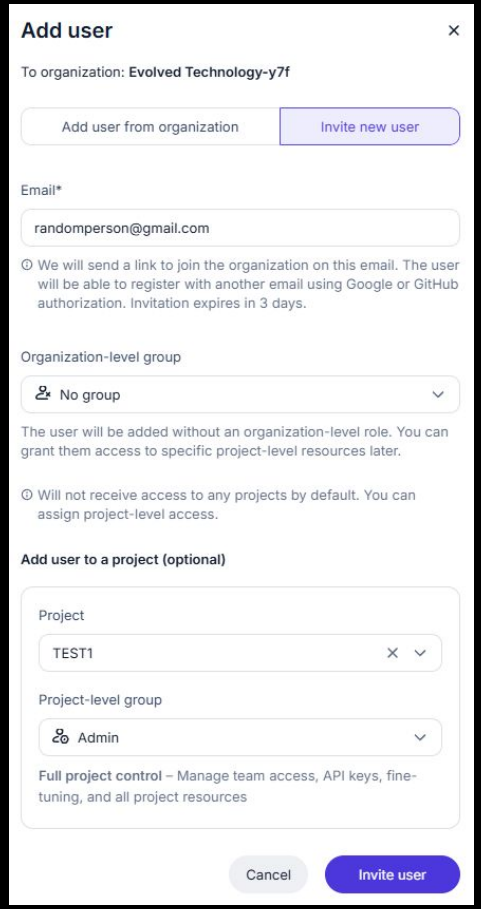


How to Redeem Credits

Step 2 - Create a new project

Add your teammates to an new project, make sure they have access to utilizing the API keys

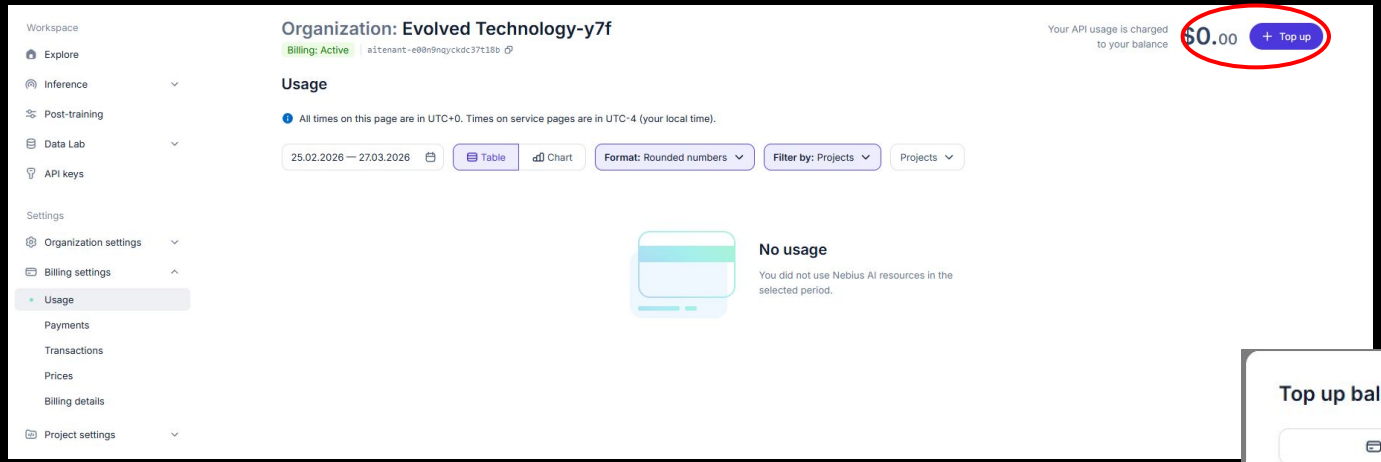


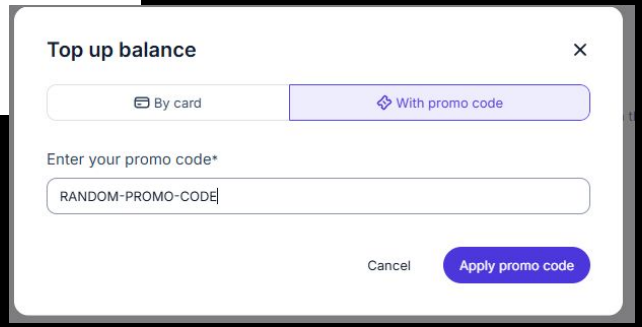


How to Redeem Credits

Step 3 - Redeem your promo codes

Select the promo code option and insert

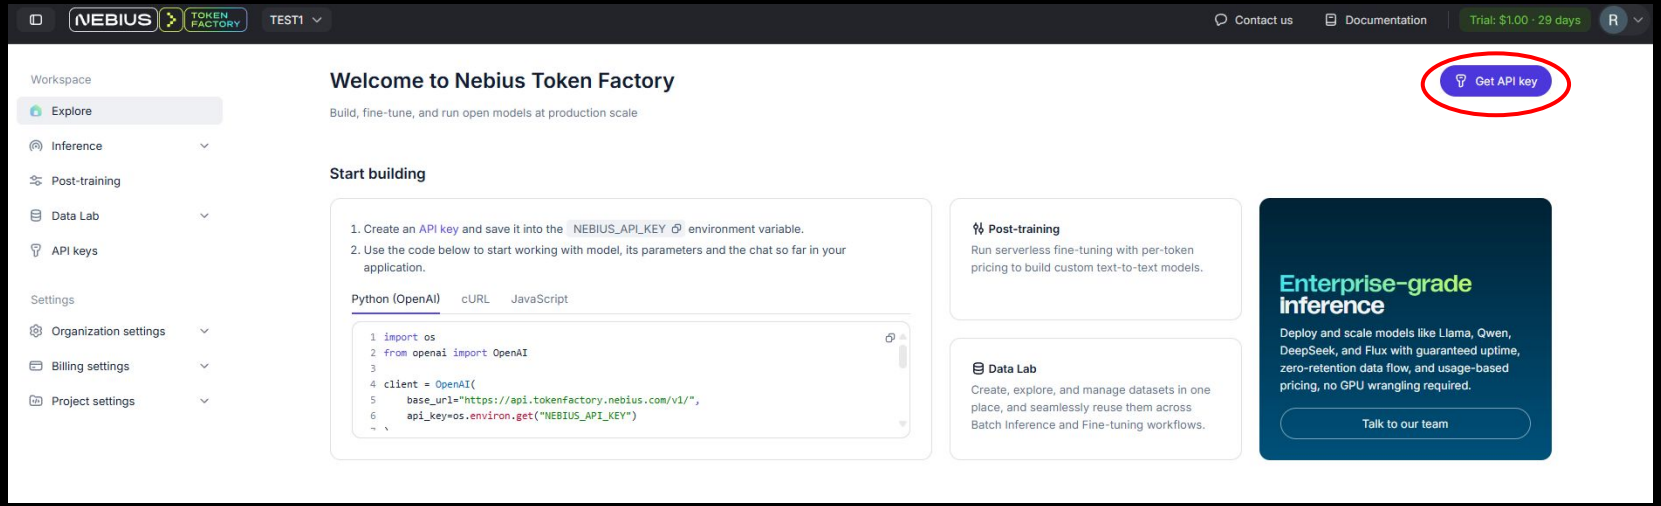




How to Redeem Credits

Step 4 - Create your API key and start Hacking!

Good place to start: https://docs.tokenfactory.nebius.com/quickstart



For non technical users, try out the playground:

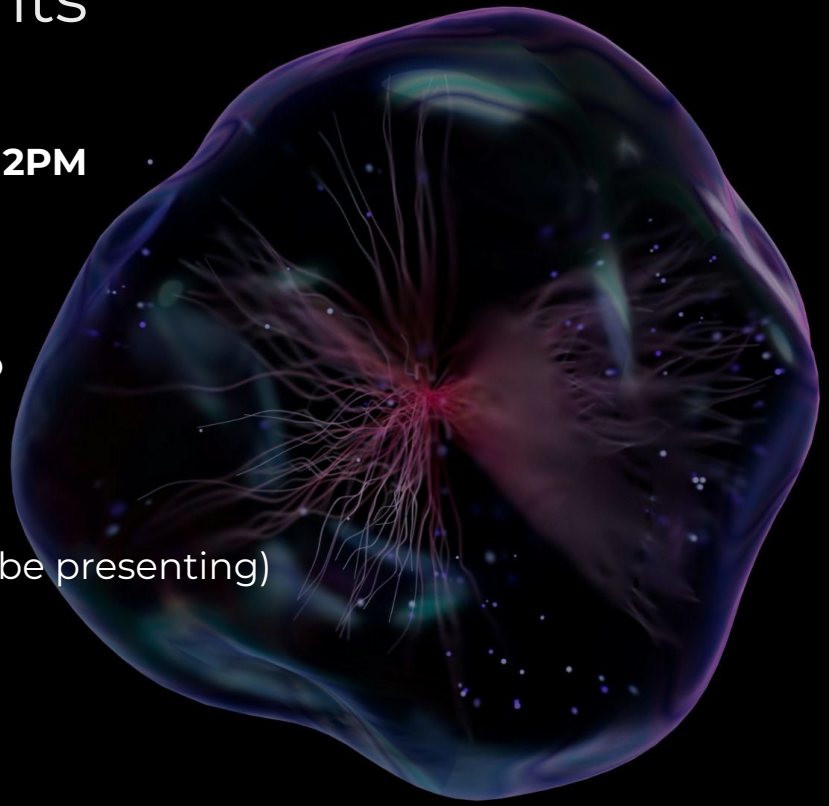
https://tokenfactory.nebius.com/playground

Submission Requirements

Submissions are due **Sunday March 29 @ 12PM**

Your submission package includes

- 0.5-1 page project description write up
- Github repo
- 2 minute video walkthrough
- 3-5 minute pitch deck (which you will be presenting)



Creating an Effective Pitch Deck

(1)
Start with the problem

what are you looking to solve?

(2)
Value proposition

How does your solution fix the problem you stated?

Many people get too technical here, keep it high level

(3)
Technology

Get technical, show them the inner workings of your solution

(4)
Market Analysis

Who is your customer? Scientists? Hospitals? Government?

(5)
Future Roadmap

Who is your current team and their expertise?

What are the next immediate steps?

Any current limitations? How do you tackle them?

What are the long term goals?

EVOLVED TECHNOLOGY

Accelerating AI breakthroughs in healthcare and life sciences
